@SQLPedro

## Focus Areas

Relational Engine: Query  
Processor,  
Programmability,  
Performance

## Agenda

- A brief history of SQL Server query performance
- Diagnostics improvements
- Adaptive Query Processing in SQL Server 2017
- Intelligent Query Processing in SQL Server 2019
- Time permits: bonus improvement

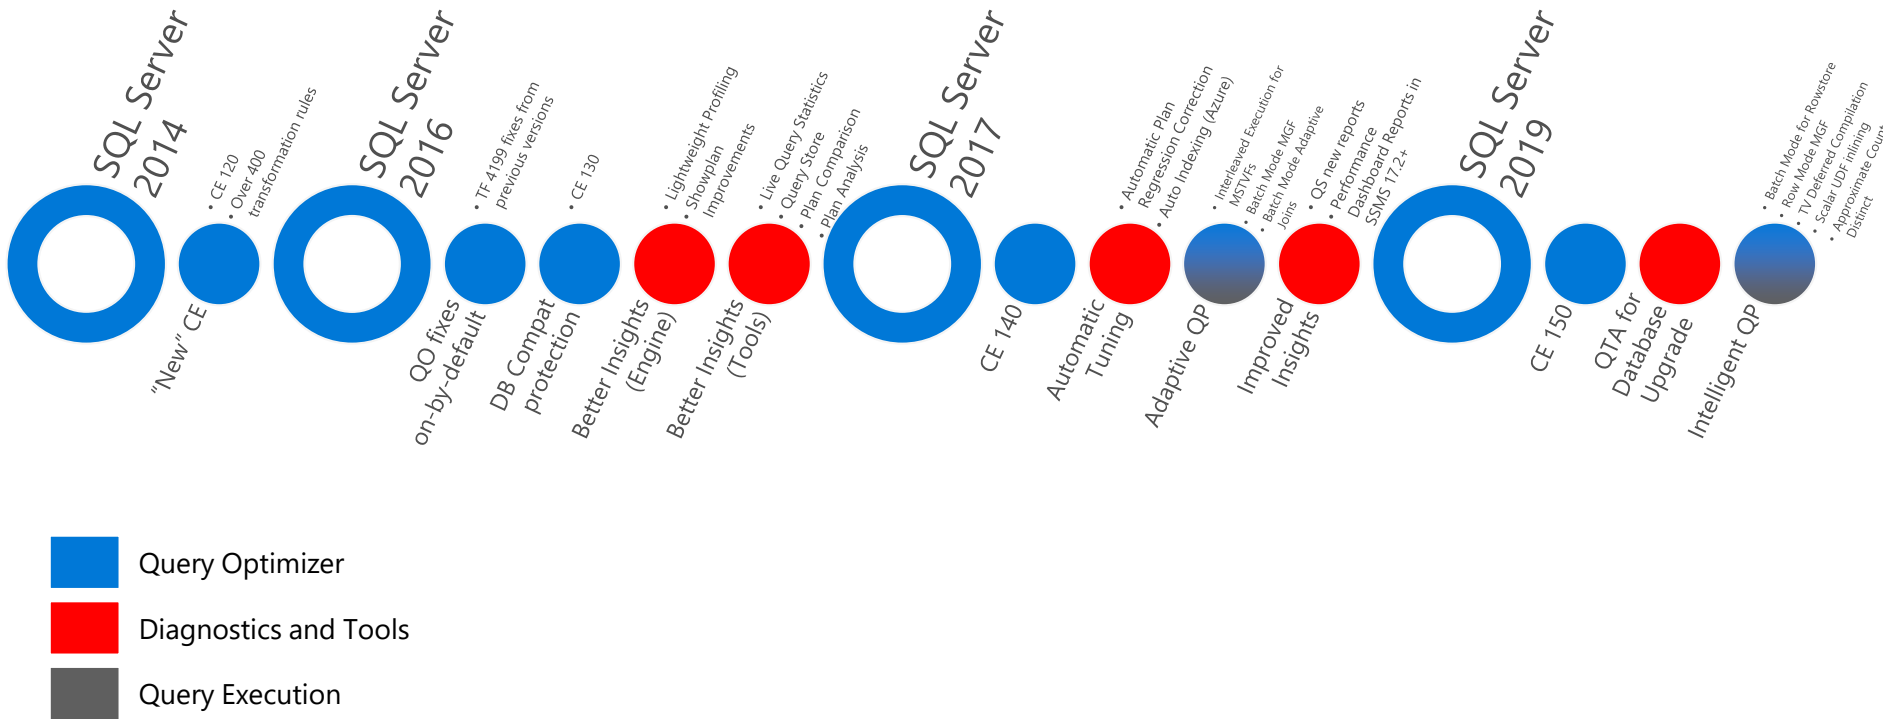

# A brief history of SQL Server Query Performance

# Query Performance Journey

Retired SQL 2000 docs available in PDF at  
[https://download.microsoft.com/download/5/4/A/54AFD350-6477-4910-9DF2-4C472C906684/SQL2000\\_release.pdf](https://download.microsoft.com/download/5/4/A/54AFD350-6477-4910-9DF2-4C472C906684/SQL2000_release.pdf)

# Query Performance Journey

# Diagnostics Enhancements

# Performance Dashboard in SSMS

## Microsoft SQL Server Performance Dashboard

Report Local Time: 5/31/2017 3:31:04 PM

(13.0.4422.0 - Enterprise Edition (64-bit))

Overall performance may be degraded because the system shows signs of being CPU-bound. This SQL Server instance is consuming the majority of the CPU. Click on any of the SQL data points in the chart below to investigate further.

### System CPU Utilization

### Current Waiting Requests

Starting with SSMS v17.2  
No extra downloads!  
No new schema to deploy!  
Long standing request by  
CSS and customers

### Current Activity

	User Requests	User Sessions
Count	27	32
Elapsed Time (ms)	4573004	741818
CPU Time (ms)	2043203(44.68%)	101108(13.63%)
Wait Time (ms)	2529801(55.32%)	640710(86.37%)
Cache Hit Ratio	100.000%	98.313%

## Query Store – new reports

Comprehensive query-performance information  
when you need it most!

# Diagnostics Enhancements

- Query Analysis

# Query plans: fundamental query perf diagnostics

How data is accessed

How data is joined

Sequence of operations

Use of temporary worktables and sorts

Estimated rowcounts, iterations, and costs from each step

Actual rowcounts and iterations

How data is aggregated

Use of parallelism

Query execution warnings

Query execution stats

Hardware/Resource stats

## Getting all context info in Showplan: Trace Flags

- Shows list of active trace flags:
  - Query
  - Session
  - Global
- Useful to understand if active Trace Flags influence execution context

TraceFlags	
[1]	
IsCompileTime	True
TraceFlag	
[1]	
Scope	Global
Value	2371
[2]	
Scope	Global
Value	7412
[3]	
Scope	Session
Value	9481
[2]	
IsCompileTime	False
TraceFlag	
[1]	
Scope	Global
Value	2371
[2]	
Scope	Global
Value	7412

TFs enabled at query compile time

TFs active at query execution time

## Getting all context info in Showplan: Times

Persisting information on elapsed and CPU times

QueryTimeStats	
CpuTime	91903
ElapsedTime	92330

Is all the elapsed time spent on CPU? Look for waits

And Scalar UDF elapsed and CPU times

QueryTimeStats	
CpuTime	628
ElapsedTime	1174
UdfCpuTime	443
UdfElapsedTime	445

How much elapsed time is spent on UDF?

More on  
Scalar  
UDFs later

# Getting all context info in Showplan: Waits

Shows top 10 waits from  
sys.dm\_exec\_session\_wait\_stats

Correlate waits  
with overall  
query times

QueryTimeStats	
CpuTime	1045
ElapsedTime	3010

Misc	
Cached plan size	160 KB
CardinalityEstimationModelV	130
CompileCPU	11
CompileMemory	728
CompileTime	136
DatabaseContextSettingsId	3
Degree of Parallelism	12
Estimated Number of Rows	121308
Estimated Operator Cost	0 (0%)
Estimated Subtree Cost	4.48002
Memory Grant	80448
MemoryGrantInfo	
Optimization Level	FULL

WaitStats	
[1]	
WaitCount	98
WaitTimeMs	3
WaitType	LATCH_SH
[2]	
WaitCount	50
WaitTimeMs	761
WaitType	PAGEIOLATCH_SH
[3]	
WaitCount	67
WaitTimeMs	1942
WaitType	LATCH_EX
[4]	
WaitCount	129
WaitTimeMs	2509
WaitType	ASYNC_NETWORK_IO
[5]	
WaitCount	2220
WaitTimeMs	30622
WaitType	CXPACKET

Note: Parallelism waits available in SQL Server 2016 SP2, 2017 CU3 and 2019

# Getting all context info in Showplan: memory

Showplan extended to include grant usage per thread and iterator

Memory Grant	783288
MemoryGrantInfo	
DesiredMemory	28592000
GrantedMemory	783288
GrantWaitTime	0
MaxUsedMemory	0
RequestedMemory	783288
RequiredMemory	4064
SerialDesiredMemory	28588448
SerialRequiredMemory	512

Is the used memory **close** to granted? Great!

Is the used memory **much below** granted?  
Hurting concurrency...

Is the used memory **above** granted?  
Possibility of OOM...

Look for memory warnings

**Faster insights**

## The middle-of-the-night call

- You're on call for supporting the data tier of a mission-critical SQL Server instance.
- Key business processes are being delayed when ETL is running.
- You get a call asking to mitigate the issue and then determine the root cause.

# Defining the problem

Reasonable hypothesis: a long running query.

But query completion is a prerequisite for the availability of an actual query plan.

So... actual query plans aren't suitable for troubleshooting complex performance issues:

- Long running queries
- Queries that run indefinitely and never finish execution.

# What we need – Query progress: anytime, anywhere

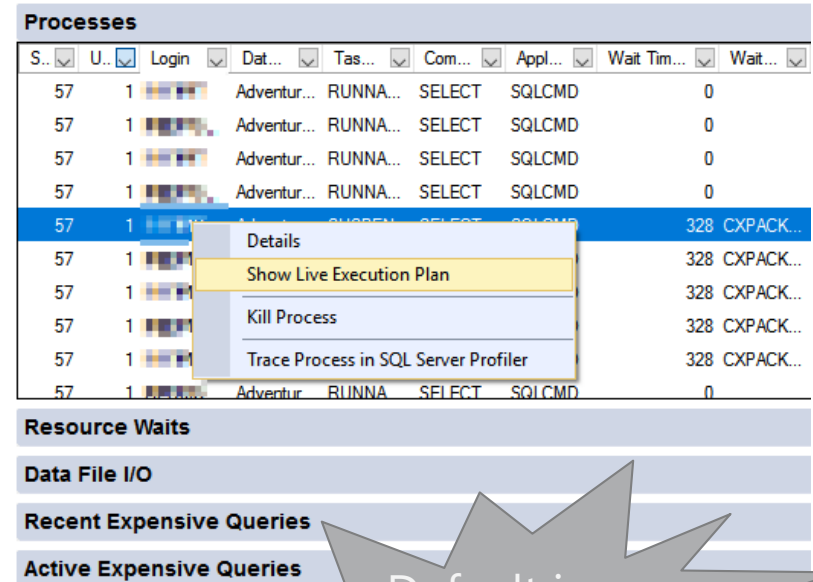

Starting with SQL Server 2016 SP1 and 2017, the new *lightweight query execution statistics profile infrastructure* allows continuous collection of per-operator query execution statistics. How?

- Using global TF 7412
- Enabling *query\_thread\_profile*, *query\_plan\_profile*<sup>\*</sup>, and *query\_post\_execution\_plan\_profile*<sup>\*\*</sup> extended events
- Using query hint `USE HINT('query_plan_profile')`<sup>\*\*\*</sup>

<sup>\*</sup> SQL Server 2016 SP2 CU3, 2017 CU11 and 2019

<sup>\*\*</sup> SQL Server 2017 CU14, 2019

<sup>\*\*\*</sup> SQL Server 2017 CU11 and 2016 SP2 CU3

# We get Live Query Statistics for all sessions!

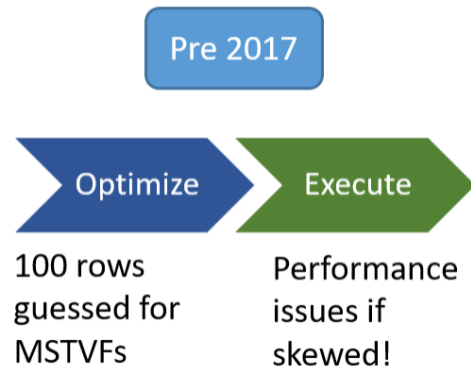

# Adaptive Query Processing

A brief retrospective

## Interleaved Execution for MSTVFs

Problem: Multi-statement table valued functions (MSTVFs) are treated as a black box by QP and we use a fixed optimization guess.

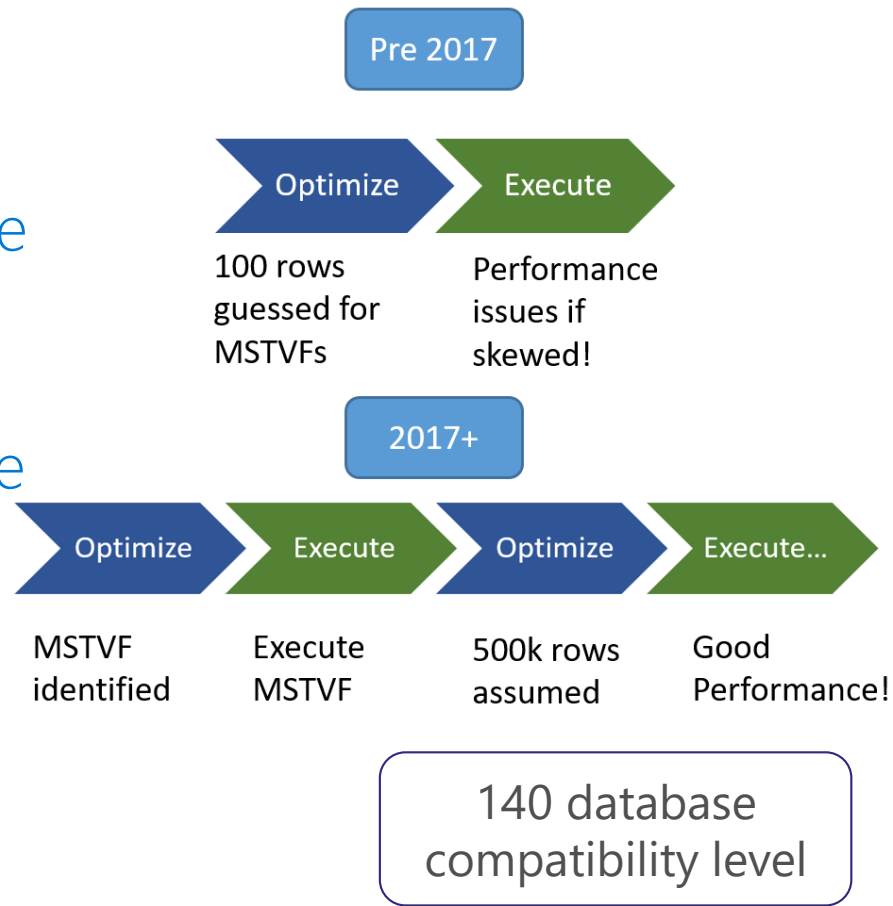

# Interleaved Execution for MSTVFs

Problem: Multi-statement table valued functions (MSTVFs) are treated as a black box by QP and we use a fixed optimization guess

Interleaved Execution will materialize and use row counts for MSTVFs.

Downstream operations will benefit from the corrected MSTVF cardinality estimate.

## Batch Mode Memory Grant Feedback (MGF)

**Problem:** Queries may spill to disk or take too much memory based on poor cardinality estimates

MGF will adjust memory grants based on execution feedback.

MGF will remove spills and improve concurrency for repeating queries.

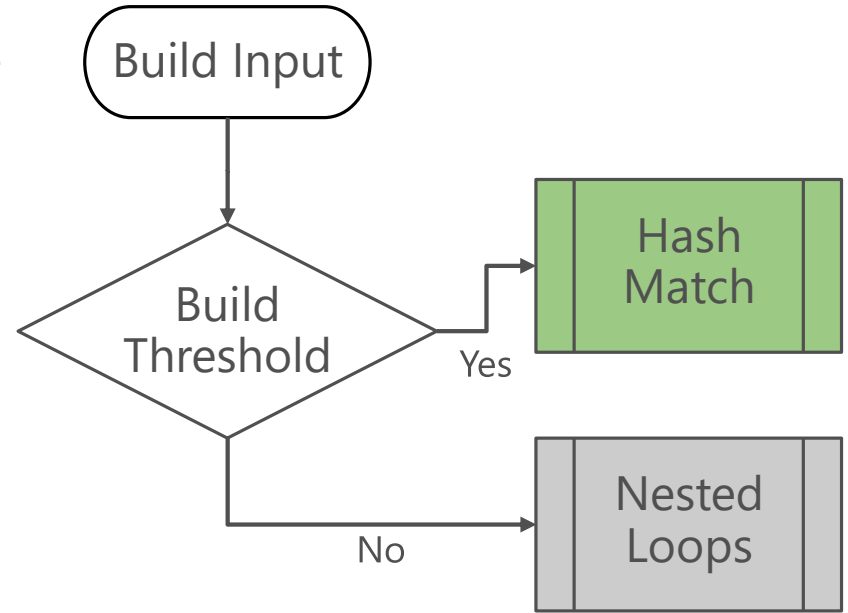

140 database  
compatibility level

## Batch Mode Adaptive Joins (AJ)

**Problem:** If cardinality estimates are skewed, we may choose an inappropriate join algorithm.

AJ will defer the choice of Hash Match or Nested Loops join until after the first join input has been scanned.

AJ uses Nested Loops for small inputs, Hash Match for large inputs.

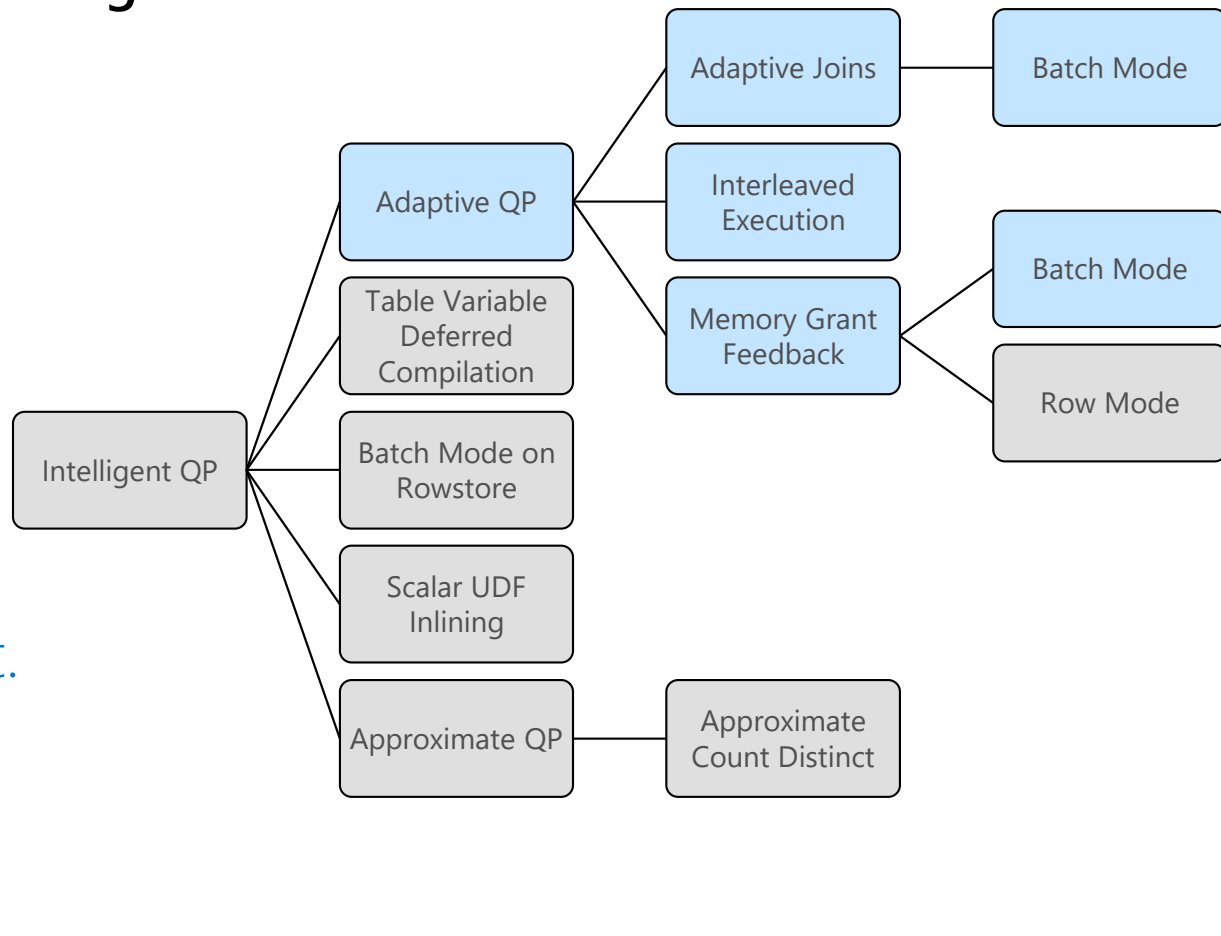

140 database  
compatibility level

Intelligent Query Processing

Broadening the scope...

# Intelligent Query Processing

The intelligent query processing feature family includes features with broad impact that improve the performance of existing workloads with minimal implementation effort.

Azure SQL Database

SQL Server 2017

SQL Server 2019

## Row Mode Memory Grant Feedback (MGF)

Same as batch-mode MGF, updating the cached plan for:

- Row-mode spills to disk = correct grant misestimations
- Row-mode excessive memory grant = avoid wasted memory, better concurrency

New query execution plan attributes to understand the state of memory grant feedback:

MemoryGrantInfo	
DesiredMemory	13992
GrantedMemory	13992
GrantWaitTime	0
IsMemoryGrantFeedbackAdjusted	YesStable
LastRequestedMemory	13992
MaxQueryMemory	1497128
MaxUsedMemory	3744

150 database  
compatibility level

# Table Variable Deferred Compilation

## Legacy behavior

Area	Temporary Tables	Table Variables
Manual stats creation and update	Yes	No
Indexes	Yes	Only inline index definitions allowed.
Constraints	Yes	Only PK, uniqueness and check constraints.
Automatic stats creation	Yes	No
Creating and using a temporary object in a single batch	Compilation of a statement that references a temp table that doesn't exist is deferred until the first execution of the statement	A statement that references a table variable is compiled along with all other statements before any statement that populates the TV is executed, so compilation sees it as "1".

# Table Variable Deferred Compilation

150 database  
compatibility level

## Azure SQL Database and SQL Server 2019 behavior

Area	Temporary Tables	Table Variables
Manual stats creation and update	Yes	No
Indexes	Yes	Only inline index definitions allowed.
Constraints	Yes	Only PK, uniqueness and check constraints.
Automatic stats creation	Yes	No
Creating and using a temporary object in a single batch	Compilation of a statement that references a temp table that doesn't exist is deferred until the first execution of the statement	Compilation of a statement that references a table variable that doesn't exist is deferred until the first execution of the statement

# T-SQL Scalar User-Defined Functions (UDFs)

User-Defined Functions that are implemented in Transact-SQL and return a single data value are referred to as **T-SQL Scalar User-Defined Functions**

T-SQL UDFs are an elegant way to achieve code reuse and modularity across SQL queries

Some computations (such as complex business rules) are easier to express in imperative UDF form

UDFs help in building up complex logic without requiring expertise in writing complex SQL queries

# T-SQL Scalar UDF performance issues!

**Iterative invocation:** Invoked once per qualifying row. Repeated context switching – and even worse for UDFs that have T-SQL queries that access data

**Lack of costing:** Scalar operators are not costed (realistically)

**Interpreted execution:** Each statement itself is compiled, and the compiled plan is cached. Although this caching strategy saves some time as it avoids recompilations, each statement executes in isolation. No cross-statement optimizations are carried out

**Serial execution:** SQL Server does not allow intra-query parallelism in queries that invoke Scalar UDFs. In other words, Scalar UDFs are parallelism inhibitors.

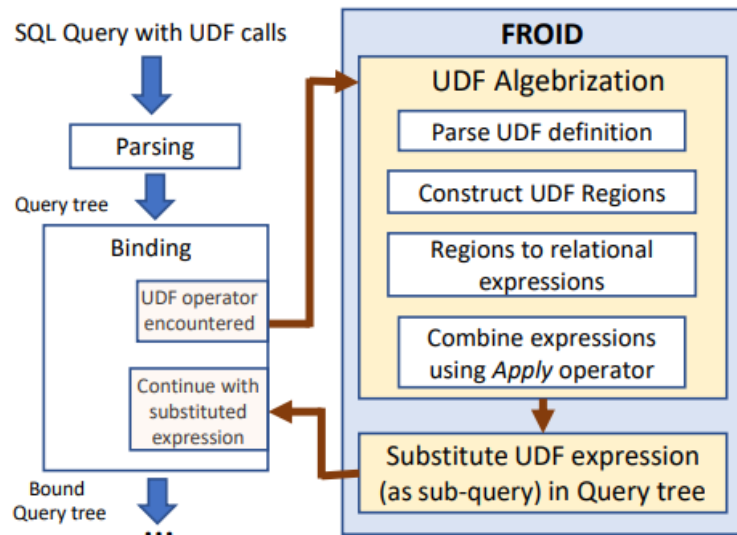

# T-SQL Scalar UDF Inlining

Enable the benefits of UDFs without the performance penalty!

- Goal of the *Scalar UDF Inlining* feature is to improve performance for queries that invoke scalar UDFs where UDF execution is the main bottleneck

Before SQL 2019/DB Compat 150:

- Using query rewriting techniques, UDFs are transformed into equivalent relational expressions that are “inlined” into the calling query

150 database  
compatibility level

# T-SQL Scalar UDF Inlining

**Table 1:** Relational algebraic expressions for imperative statements (using standard T-SQL notation from [33])

Imperative Statement (T-SQL)	Relational expression (T-SQL)
DECLARE {@var data.type [= expr]}[,...n];	SELECT {expr null AS var}[,...n];
SET {@var = expr}[,...n];	SELECT {expr AS var}[,...n];
SELECT {@var1 = prj_expr1}[,...n] FROM sql_expr;	{SELECT prj_expr1 AS var1 FROM sql_expr}; [,...n]
IF (pred_expr) {t_stmt; [,...n]} ELSE {f_stmt; [,...n]}	SELECT CASE WHEN pred_expr THEN 1 ELSE 0 END AS pred_val; {SELECT CASE WHEN pred_val = 1 THEN t_stmt ELSE f_stmt; }[,...n]
RETURN expr;	SELECT expr AS returnVal;

## Scalar UDF Inlining candidates

Existing UDFs will be inlined during compilation with no need to make changes.

First version candidates:

- DECLARE, SET: Variable declaration and assignments.
- SELECT: SQL query with multiple variable assignments.
- IF/ELSE: Branching with arbitrary levels of nesting.
- RETURN: Single or multiple return statements.
- UDF: Nested/recursive function calls.
- Others: Relational operations such as EXISTS, ISNULL.

## To inline, or not to inline

See *sys.sql\_modules* catalog view includes a property called *is\_inlineable*:

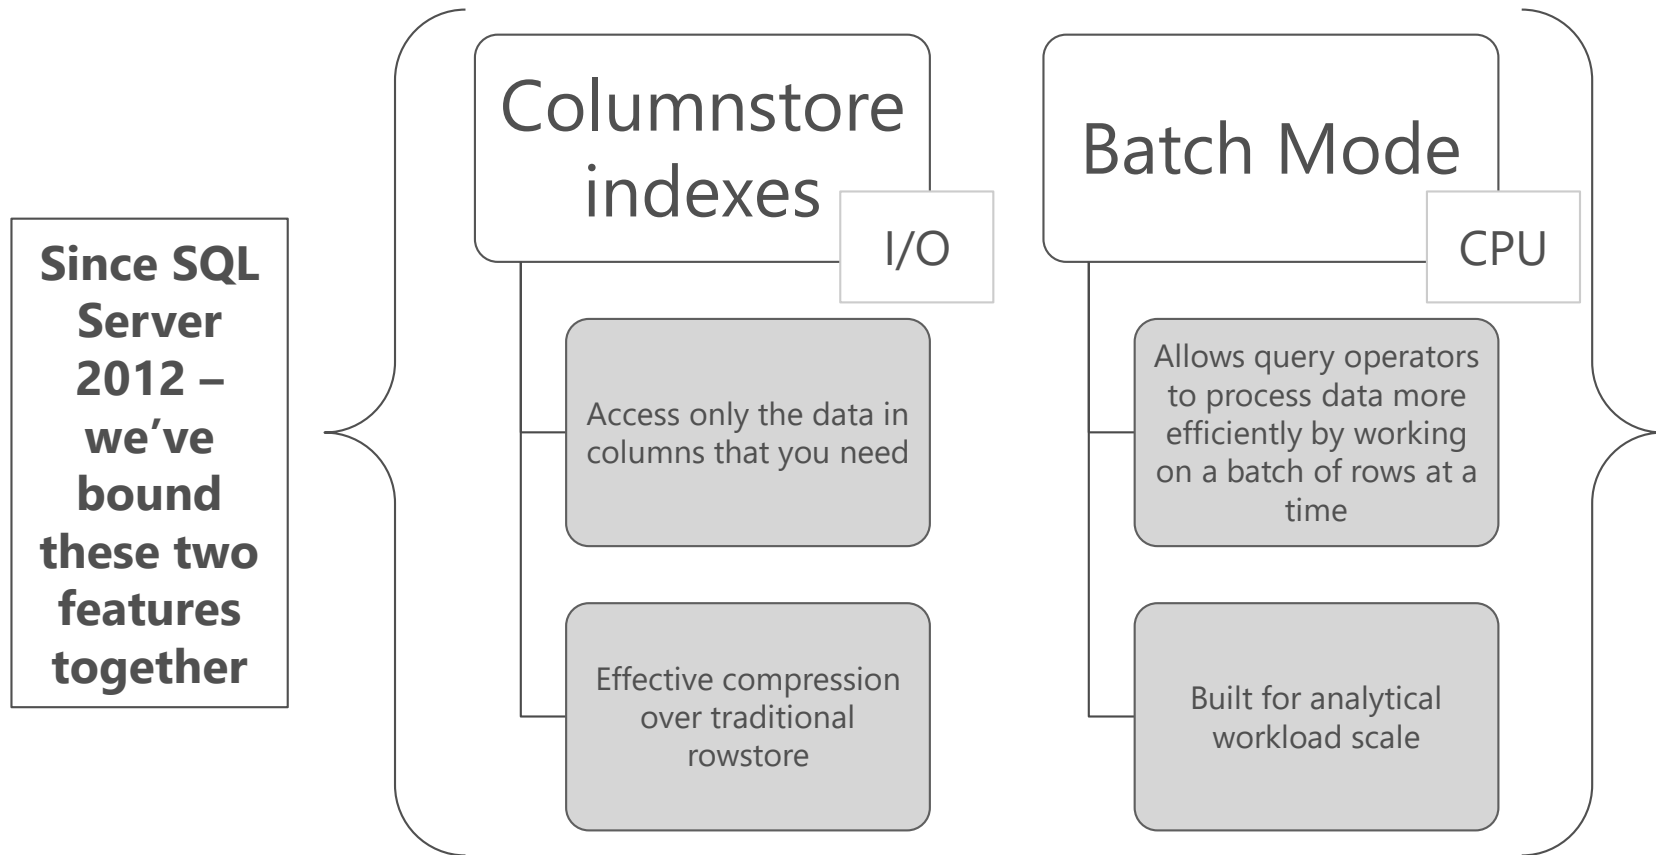

- 1 indicates that it is inlineable, and 0 indicates otherwise
- Value of 1 for all inline TVFs as well

If a scalar UDF is inlineable, it doesn't imply that it will always be inlined. SQL Server will decide (on a per-query, per-UDF basis) whether to inline a UDF or not if:

- UDF definition has thousands of lines of code (itself or by using nesting)
- UDF used in a GROUP BY clause

Decision is made when the query referencing a scalar UDF is compiled.

# Batch Mode and Columnstore

# Batch Mode on Rowstore

150 database  
compatibility level

Sometimes Columnstore isn't an option:

- OLTP-sensitive workloads
- Vendor support
- Columnstore interoperability limitations

Now get analytical processing CPU-benefits **without Columnstore indexes.**

Batch mode on rowstore supports:

- On-disk heaps and B-tree indexes and existing batch-capable operators (**new scan operator** can evaluate batch mode bitmap filters)
- Existing batch mode operators

## Batch Mode on Rowstore candidate workloads

A significant part of the workload consists of analytical queries  
**AND**

The workload is CPU bound **AND**

- Creating a columnstore index adds too much overhead to the transactional part of your workload **OR**
- Creating a columnstore index is not feasible because your application depends on a feature that is not yet supported with columnstore indexes **OR**
- You depend on a feature not supported with columnstore (for example, triggers)

## Batch Mode on Rowstore considerations

There is no guarantee that query plans will use batch mode.

No guarantee that if you get a row mode plan, it will be the same as the plan you get in a lower compatibility level.

No guarantee that if you get a batch mode plan, it will be the same as the plan you'd get with a columnstore index.

Plans may also change in subtle ways for queries that mix columnstore and rowstore indexes, because of the new batch mode rowstore scan.

## APPROX\_COUNT\_DISTINCT - When approximate is good enough...

Provides approximate COUNT DISTINCT for big data scenarios with the benefit of high performance and a **(very) low memory** footprint.

Dashboard scenarios and trend analysis against big data sets with many distinct values (for example, distinct orders counts over a time period) – and many concurrent users where exact values are not necessary.

Data science big data set exploration. Need to understand data distributions quickly and exact values are not paramount.

*Not banking applications or anywhere an exact value is required!*

# DEMO

## Intelligent Query Processing

## Intelligent QP next steps...

- Regressions due to a feature?
- Situations where something didn't kick off and you think it should have?

These features are in public preview – and we want your feedback!

Please email [IntelligentQP@Microsoft.com](mailto:IntelligentQP@Microsoft.com)

## The infamous truncation error

### Loading data into a table, and hitting

Msg 8152, Level 16, State 30, Line 13  
String or binary data would be truncated.  
The statement has been terminated.

It will be  
default in  
SQL Server  
2019

### Starting with SQL Server 2019 CTP 2.1, you get this:

Msg 2628, Level 16, State 1, Line 14  
String or binary data would be truncated in table  
'Adventureworks2016CTP3.Sales.SalesOrderHeaderTest', column  
'CreditCardApprovalCode'. Truncated value: '1231736Vi8604'.  
The statement has been terminated.

Also in SQL Server 2017 CU12 and upcoming SQL Server 2016 SP2 CU6

- Needs TF 460
- See more in blog post @ <http://aka.ms/sqlserverteam>

# We'd love your feedback
